Synthetic.

Modified hedgehog protein, useful in the treatment of Parkinson's disease and Huntington's chorea, comprises a polymer containing a polyalkylene glycol group linked to any residue other than the N-terminal and lysine residues. Garber Pepinsky RB, Taylor F, WPI; 2001-049927/06.

Example 6; Page 77; 157pp; English.

The invention relates to novel polymer conjugates of hedgehog proteins which have increased bioavailability. The hedgehog proteins are conjugated to a non-naturally-occurring polymer comprising a polyalkylene glycol group, with the proviso that the polymer is not conjugated to the glycol group, with the proviso that the polymer is not conjugated to the N-terminus, or to lysine residues of the hedgehog protein. The hedgehog protein used in the conjugate may be a wild-type or mutant sonic hedgehog protein by indian hedgehog (Ihh) or Desert hedgehog (Dhh) protein, or may be a hedgehog fusion protein. The invention also relates to methods of a defining and mapping functionally important regions of a protein by modifying accessible amino acid side chains, and determining the effect the position and/or type of modification have on the activity of the correct or the position and/or type of modification have on the activity of the protein. The hedgehog polymer conjugates may be used in the management of various medical conditions including various neurological disorders.

Command the hedgehog polymer conjugates will cancers. In particular, they may be used to prevent preventing or ameliorate neurological disorders (e.g., Parkinson's disease, Allentimet's disease), age-associated neurological disease, neurological injury and trauma; immunological diseases of the nervous system (e.g., multiple collerosis); stroke; and malignant gliomas, medulloblastomas and neuroectodermal tumours. The modifications made to the hedgehog protein may result in increased half-life, altered tissue distribution (such as

```

```

```
an improved ability to stay in the vasculature for longer periods of time), increased stability in solution, protection from protectly degradation, or reduced immunogenicity. In particular, the ability to remain in the vasculature for prolonged periods may allow a hedgehog protein of the invention to cross the blood-brain barrier, and an increased thermal stability would be an advantage when formulating the hedgehog protein in powder form. The present sequence represents a human solution primer used in an exemplification of the

The sequences given in AAQ91654-57 are primers which were used to amplify a sequence which encodes a human sonic hedgehog protein, homologous to a brosophila hedgehog protein (AAR77337). The human sequence was isolated by screening of human genome DNA by nested polymerase chain reaction using these primers, followed by use of a clone to screen a human fetal lung 5'-stretch plus cDNA library in phage lambda-gt10. A clone has been primers SHHF (AAQ91654) and SHH (AAQ91655), to give clone SHHP1. A 2.5-kb ECORI CA repeat fragment is amplified using primers SHHCAR (AAQ91656) and SHHPAR (AAQ91657). Probes and primers derived from the sonic hadgehog sequence may be used as diagnostic agents for neuromuscular, autonomic or central nervous system disorders, and the gene may also be used in gene therapy. Antibodies generated from the encoded protein may be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sonic hedgehog; SHH gene; HH gene; tumorigeneais; oncogeneais; basal cell carcinoma; breast cancer; medulloblastoma; tumour; cell proliferation; cell differentiation; diagnosis; therapy; human; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hedgehog-like protein(s) and nucleic acid(s) encoding them - useful treat degenerative nervous system disorder(s) and in gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for determining the presence of neoplastic molecular markers in a host, involving the use of neoplastic molecular marker specific reagents to detect such markers and analysing the array of reagents, allowing the identification of the neoplastic disease present. This can be used to determine the best treatment for cancers, in particular neural cell, lung and prostate tumours. The present sequence is a PCR primer useful for detecting the coding sequences of markers of the invention

This human sonic hedgehog (SHH) gene exon 2-specific primer was used with another exon 2-specific primer (see AAV18406) in a PCR using DNA from Muman bacterial artificial chromosome (BAC) DNA pools. Only pools comprising a BAC that contains the sequence tag defined by the primer pair will yield an amplification product. The process was continued until as ingle positive BAC was identified. The positive clone, BAC270A17, was dispessed with restriction enzymes and ligated into vectorette linkers. Mutations (see AAV18403 and AAV18404) have been identified in the SHH gene in Muman cancers. The mutated SHH genes and the encoded polypeptides (see AAW48735 and AAW48736) can be used in methods for the treatment and diagnosis of cancer and other diseases involving cell proliferation or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, Sonic hedgehog, Shh, morphogenic signal; neuron; embryonic patterning; cell culture; cell differentiation; ischaemia; cell proliferative disorder; intracerebral grafting; Huntington's chorea; neurological disorder; Alahaimer's disease; Parkinson's disease; amyotrophic lateral sclerosis; ALS; multiple sclerosis; PCR primer; ss.
                                                                                                                                                                                                          New nucleic acid encoding oncogenic human hedgehog protein - useful for, e.g. treatment and diagnosis of cancer and diseases involving cell proliferation or differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human Sonic hedgehog (Shh) gene amplifying forward PCR primer SHHF

The present invention relates to assay for screening compounds that corporate or inhibit binding of hedgehog polypeptide to naturally concurring patched receptor. The hedgehog proteins comprise morphogenic signals produced by embryonic patcarning centres, and are involved in the formation and maintenance of ordered spatial arrangements of differentiated tissues in vertebrates, both adult and embryonic. The proteins can be used to generate and/or maintain a marray of different corporate tissues both in vitro and in vivo. The invention also relates to ammanian cell (e.g. neuron, testicular cell) responsive to hedgehog induction. Hedgehog agonists and anicagomists can be used in cell culture techniques to enhance survival and maintenance of neurons and various vertebrate organogenic patchways. The hedgehog gene is useful in determining whether a patient is at the risk of disorder characterised by unwanted cell proliferation or aberrant control of differentiation. The ceptangon proteins or mimetics can be used to induce foctal neurons especially neuronal stem cells in intracerebral grafting. The protein or its mimetic can be used in the treatment of neurological conditions e.g. cinjury to nervous system, isochaemia resulting from Erroke, Alzheimer's condisease, Parkinson's disease, Hunthington's chorea, amyotrophic lateral conditions c
                                                                                                                                                     Screening compounds that potentiate or inhibit binding of hedgehog polypeptide to naturally occurring patched receptor, comprises contacting polypeptide with receptor and test compound, and detecting change in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0; Gaps

PCR primers AAC87097-98 were used to amplify cDNA encoding a hedgehog related-protein. The specification describes a sonic hedgehog protein (ShN), a desernt hedgehog protein (DhN), and an indian hedgehog protein (IN). The hedgehog polynuclectides are useful in diagnostic, in antisense therapy and in therapeutic assays for detecting and treating disorders involving, e.g., aberrant expression of vertebrate hedgehog completes involving, e.g., aberrant expression of vertebrate hedgehog completes involving, e.g., aberrant expression of vertebrate hedgehog conditions deriving from acute, subacute, or chronic injury to the conditions deriving from acute, subacute, or chronic injury, vasal injury conditions system, including traumatic injury, chemical injury, vasal injury conditions from stroke), together with infectious/inflammatory and induced injury, aging of the nervous system including Alzheimer's disease, chronic neurodegenerative diseases of the nervous system, including Parkinson's disease, Huntington's chorea, amylotrophic lateral sclerosis, spinocerebellar degenerations, and chronic immunological diseases of the nervous system or affecting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sonic hedgehog; Shh; desert hedgehog; Dhh; Indian hedgehog; Ihh; antiparkinsonian; antiarrhythmic; neuroprotective; anticonvulsant; cytostatic; noctropic; spermatogenesis; peripheral nervous system; central nervous system; Alzheimer's disease; Parkinson's disease; Huntington's disease; arrhythmia; nerve degeneration; multiple sclerosis; immunological disorder; neoplastic; hyperplastic; PCR primer; ss.
               Polynucleotides encoding hedgehog proteins, useful for treating diseases of nervous system such as Alzheimer's disease, Parkinson's disease, Huntington's chorea, amylotrophic lateral sclerosis, multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5.6%; Score 24; DB 1; Length 24;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                   The invention relates to nucleic acids encoding hedgehog proteins selected from sonic hedgehog (Shh), indian hedgehog (Ihh), desert hedgehog (Dh) polypeptides. The hedgehog genes are involved in the formation of ordered spatial arrangements of differentiated tissue in vertebrates. The nucleic acid sequences are useful for producing hedgehog proteins, used for promoting differentiation of, or survival of differentiation on unronal cells, and for promoting proliferation, survival or differentiation of mesenchymal, endodermal or ectodermal tissue, particularly chondrocytes, or testicular germ line cells. Sequences AAH76132-133 represent PCR primers for amplifying a human Shh DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hedgehog related-protein, sonic hedgehog protein, Shh; ischemia; stroke; desert hedgehog protein, Dhh; indian hedgehog protein, Ihh; neuron; neurological condition; nervous system injury; tumour-induced injury; aging; Alzheimer's disease; chronic neurodegenerative disease; barkinson's disease; thronic neurodegenerative disease; spinocease; thuntington's chorea; amylotrophic lateral sclerosis; spinoceachelar degeneration; chronic immunological disease; multiple sclerosis; PCR primer; ss.

New vertebrate hedgehog-related proteins, useful e.g. for promoting differentiation, survival and proliferation of cells, e.g. for treating neurodegeneration. 

The present invention describes an isolated and/or recombinant configuration of comprising a hedgehog (hh) amino acid (aa) sequence polypeptide (I) comprising a hedgehog (hh) amino acid (aa) sequence concoded by a nucleic acid (II) that hybridizes under stringent conditions to 1 of 6 sequences (see ABN87544, and ABN87546 to ABN87550). (I) binds to a natural patched receptor. Specifically claimed example of (I) are concrepted neuroprotective, anticonvulsant, antiarrhythmic and cytostatic activities. (I) induces the expression of the BMP-2 and -4 genes, and of the Howa gene. (I) and be used: (i) to promete differentiation of courconal cells and survival of the differentiation of courconal cells and survival of the differentiation of copaminergic or motor neurons, proliferation of chondrocytes, and companiergic or motor neurons, proliferation of chondrocytes, and concordermal cells, either in cell cultures (particularly for preparation of transplants) or therapeutically; (ii) for detecting loss of response, in tissues or, to hh proteins, (iii) in drug screening (to identify (art) agonists, useful e.g. for inhibition of spermatogenesis); and (iv) correct collation of cognate receptors. (I) may be used therapeutically to treat e.g. injuries/defects in the central or peripheral nervous systems, e.g. multiple sclerosis, neoplastic and hyperplastic concorder system, e.g. multiple sclerosis, neoplastic and hyperplastic concorder system, e.g. multiple sclerosis, neoplastic or promote attachment of prostheses. The present sequence represents a PCR primer for human sonic concorder invention in the exemplification of the present Example 5; Col 88; 116pp; English.

Modulating growth, differentiation or survival of a cell, useful for treating a degenerative disorder of the nervous system characterized by neuronal cell death, comprises contacting the cell with a hedgehog polypeptide.

Example 5; Page 48; 121pp; English.

The invention relates to a method for modulating growth, differentiation or survival of a cell, comprising contacting the cell with a hedgehog polypeptide. The invention also relates to methods for inducing a cell to differentiate to a neuronal cell phenotype comprising contacting the cell carget tissue of a hedgehog polypeptide to cause chrondrogenesis and/or osteogenesis in the target tissue and treating a degenerative disorder of the nervous system characterised by neuronal cell death, comprising cadministerings a hedgehog polypeptide causing prolonged survival of neural cells in the patient, relative to the absence of hedgehog treatment. The hedgehog polypeptides are useful for treating a degenerative disorder of cells in the patient, relative to the absence of hedgehog treatment. The hedgehog polypeptides are useful for treating adegenerative disorder of the nervous system characterised by neuronal cell death, including concerns accordance of hedgenoration accordance or central nervous system disorders, precipied and secondary autonomic or central nervous system disorders, precipied and secondary autonomic or central nervous system disorders including disorders affecting from anoxia, ischaemia or trauma and neuronal degeneration associated with a natural aging process. The call sorders affecting peripheral nervoe innervation of smooth muscle and peripheral nerve damage, for treating peripheral nerve damage, for treating neoplastic or hyperplastic and peripheral nerve damage, for treating neoplastic or hyperplastic crasping for the development of stem cells of the heart, in nerve prostheses for repairing central carponating the heart, in nerve prostheses for repairing central corpusible for the formation of the digestive tract, liver and other corpusion of the digestive race, liver and other corpusions. This sequence represents a PCR primer used to amplify condition the human Sonic hedgehog (Shh) polypeptide.

```
The invention relates to an isolated antibody (I) which is immunoreactive with a hedgehog polypeptide (II) that binds to a patched receptor, where (II) is encoded by uncleic acid which hybridise to a fully defined vertebrate hedgehog (hh) protein. (I) is useful as a hedgehog antagonist by blocking action of naturally occurring hedgehog protein, and therefore for inhibiting spermatogenesis. (I) is also useful for inhibiting normal ovarian function. (I) is useful for inhibiting normal ovarian function. (I) is useful for blocking the action of one or more hedgehog proteins and allows the study of the role of these proteins e.g., embryogenesis and/or maintenance of differential tissue succeed to evaluate the abundance and pattern of expression of the hedgehog protein abundance and pattern of expression of the hedgehog protein to detect and evaluate hedgehog procedure. The present sequence represents as a part of clinical testing procedure. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention relates to a novel method for modulating growth, differentiation or survival of a cell. The method involves contacting the cell with a hedgehog polypeptide such as Desert hedgehog (Dhh), Sonic hedgehog (shh) and indian hedgehog (inh). The method is used to induce a cell to differentiate to a neuronal cell phenotype. It is used to modulate skeletogenesis. The method is used to treat a degenerative disorders of the nervous system such as neuronuscular, autonomic or central nervous system such as neuronuscular, autonomic or disease, amyotrophic lateral sclerosis, Huntington's disease, Parkinson's disease, amyotrophic lateral sclerosis, Huntington's disease, multiple sclerosis, Pick's disease, neuronal degeneration associated with a neuronal damage resulting from trauma and neuronal damage resulting from trauma and neuronal damage resulting from anoxia-ischaemia. The invention is also used for antisense gene therapy. The present sequence is human shu DNA amplifying PCR primer. This sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hedgehog polypeptide; tissue array generation; tissue array maintainance; hedgehog; human; PCR; primer; ss.
                                                                                                                                                                                                                                               Modulating cell growth, differentiation or survival, for treating neurodegenerative diseases, such as Alzheimer's or Parkinson's disease, comprises contacting the cell with a hedgehog polypeptide.

New nucleic acid encoding a hedgehog polypeptide having an amino acid sequence identical or homologous to a vertebrate hedgehog protein, useful for generating or maintaining an array of different vertebrate tissue in vitro and in vivo.

Example 5; SEQ ID NO 43; 118pp; English.

The invention describes an isolated nucleic acid encoding a hedgehog polypeptide having an amino acid sequence identical or homologous to a vertebrate hedgehog protein or its portion and not identical to a fully defined 471-bp sequence. The nucleic acid is useful for generating and/or maintaining an array of different vertebrate tissue both in vitro and in vivo. This sequence represents a primer used to isolate DNA encoding vivo. This sequence r human sonic hedgehog.

New nucleic acid encoding oncogenic human hedgehog protein - usefue.g. treatment and diagnosis of cancer and diseases involving cell proliferation or differentiation.

Example; Page 23; 47pp; English.

used with This human sonic hedgehog (SHH) gene exon 2-specific primer was used v another exon 2-specific primer (see AAV18406) in a PCR using DNA from

human bacterial artificial chromosome (BAC) DNA pools. Only pools comprising a BAC that contains the sequence tag defined by the primer pair will yield an amplification product. The process was continued until a single positive BAC was identified. The positive clone, BAC270A17, was digested with restriction enzymes and ligated into vectorette linkers. Mutations (see AAV18403 and AAV18404) have been identified in the SHH gene in human cancers. The mutated SHH genes and the encoded polypeptides (see AAW48735 and AAW48735) can be used in methods for the treatment and diagnosts of cancer and other diseases involving cell proliferation or differentiation 8X3333333333X8

Culture method for cartilage differentiation from cells under hypoxic conditions into cartilage cells applicable in cartilage transplantation, and studying genes or proteins relating to joint diseases. 

Example 3; Page 29; 37pp; Japanese.

The present invention describes a method for cartilage differentiation by culturing cells capable of differentiating into cartilage under hypoxic conditions. Also described: (1) a method for producing cartilage cells or cartilage by culturing the required cells under hypoxic conditions; (2) drugs containing the produced cartilage cells or cartilage. (3) a method for preventing or treating joint diseases by transplanting an effective amount of the cartilage cells or cartilage; (4) the use of the cartilage cells or cartilage; (5) a method for screening genes relating to cartilage differentiation or joint diseases by using any of the culture methods; (6) a method for screening promoters or inhibitors of cartilage differentiation by using any of the culture methods; (7) a method for screening preventure methods; (7) a method for screening preventure methods; (7) a method for screening preventure methods; (8) a method for screening preventure methods; (9) a method for screening preventure methods; (1) a method for screening preventure methods; (2) a method for screening preventure methods; (3) a method for screening preventure methods; (1) a method for screening preventure methods; (2) a method for screening preventure methods; (3) a method for screening preventure methods; (2) a method for screening preventure methods; (3) a method for screening preventure methods; (2) a method for screening preventure methods; (3) and screening preventure methods; (3) a method for screening preventure methods; (4) a method for screening preventure methods; (5) a method for screening preventure methods; (6) a method for screening and screening preventure methods;

cDNA derived from human epidermal keratinocytes was amplified by 3-stage nesting using sonic hedgehog (SHH) gene stage 1 primers (see AAV18413 and AAV18414).

AAV18414), stage 2 primers (see AAV18415 and AAV18416) and stage 3 primers (see AAV18415 and AAV18415). The PCR product was identified as authentic SHH, A single somatic mutation (see AAV18403) of the SHH gene was found in cancers arising from 3 different tissues in independent patients. Another mutation (see AAV18404) was identified in another cancer. The mutated SHH genes and the encoded polypeptides (see AAV48735) and AAV48736) can be used in methods for the treatment and diagnosis of cancer and other diseases involving cell proliferation or differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sonic hedgehog; SHH gene; HH gene; tumorigenesis; oncogenesis; basal cell carcinoma; breast cancer; medulloblastoma; tumour; cell proliferation; cell differentiation; diagnosis; therapy; human; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New mucleic acid encoding oncogenic human hedgehog protein - useful for, e.g. treatment and diagnosis of cancer and diseases involving cell proliferation or differentiation.

PCR primers (see AAV18407-08 and AAV18411-12) specific for SHH exons 1 and 3 were also used. PCR and AAV18411-12) specific for SHH exons 1 and 3 were also used. PCR and AAV1840s. 2 Mutations (see AAV18403 and AAV18404) were identified in the SHH gene from 4 human cancers. The mutated SHH genes and the encoded treatment and diagnosis of cancer and other diseases involving cell proliferation or differentiation
methods; (8) drugs containing the screened promoters or inhibitors of cartilage differentiation, or preventives or remedies for joint diseases; (9) a method for preventing or treating joint diseases by administering an effective dose of the promoters or inhibitors, or preventives or remedies to mammals; and (10) the use of the promoters or inhibitors, or preventives or remedies for producing drugs for joint diseases. The produced cultured cartilage cells or cartilage can be used in cartilage transplantation, studying genes or proteins relating to joint diseases and screening drugs for their treatment, including diseases of bone fracture, myeloma, osteoporosis and rheumatoid arthritis. The present sequence represents a PCR primer for Indian hedgehog, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sonic hedgehog; SHH gene; HH gene; tumorigenesis; oncogenesis; basal cell carcinoma; breast cancer; medulloblastoma; tumour; cell proliferation; cell differentiation; diagnosis; therapy; human; PCR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is conceins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome 7922.1, MD24 is encoded at chromosome 7922.2, MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 15p11.2 and MD212 is encoded at chromosome 15p11.2 and MD212 is encoded at chromosome 15p11.2 and MD212 is encoded at chromosome or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23. MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for disgnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene expression. The proteins are useful as therapeutic agents for gene expression. The vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its consequences including one of 2,018,500 fully defined sequences, or its consequence match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation to a DNA library, or at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of hybridising at least one or more nucleic acids to at least two or more nucleic acids to probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific comparations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones of for additional subclones containing segments of DNA that have been contained and previously sequenced in the microarray. Note: The sequence of the form the form at a pardiar an also be obtained in electronic format directly from them instructions of the sequence of the format directly an also manience when the comparation is a series.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

This sense primer corresponds to nucleotides 460-479 of a cDNA clone (see AAV62396) coding for novel human Desert hedgehog protein (see AAW79596).

I was used with an antisense primer (see AAV6211) in a first-steep PCR amplification of human leukaemia plasma cell line ARH-77 (ATCC CRL-1621) cDNA in a modified PCR method of 3'RACE. 2 Subsequent PCR amplifications (see AAV62423-26) yielded a cDNA clone (see AAV6239) encoding a C-terminal fragment (see AAW79599) of the novel human Desert hedgehog protein. Nucleotide sequences (see AAV62339-95) encoding mature and precursor forms (see AAW79593-55) of human Desert hedgehog are claimed. The Desert hedgehog DNA, protein and a claimed monoclonal antibody can be used in to elucidate hereditary morphological abnormalities in humans to establish their treatments and diagnoses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR primer, neuroectoderm cell; cell production; Parkinson's disease; early primitive ectoderm-like cell; EPL cell; cell therapy; transgenic animal; gene therapy; neuronal disease; Huntington's disease; lysosomal storage disease; multiple sclerosis; memory disorder; behavioural disorder; Alzheimer's disease; organ transplant;

This sequence represents a PCR primer for the Shh gene, used within the scope of the invention. The invention relates to a method for producing scope of the invention. The invention relates to a method for producing concrected early primitive ectoderm—like (EPL) cells and a neural-inducing conditioned primitive ectoderm—like (EPL) cells and a neural-inducing conditioned confident to a mine sufficient to generate controlled differentiation to (I). The cells or partially differentiated progeny are differentiation to animal cell therapy, transgenic animal production, confiderentiated progens in neuroectoderm cells or their partially differentiated progeny and evaluation of fearth of producing confiderentiated progeny and evaluation of pological molecules that direct differentiation of neural cells. The method is useful for producing concrectederm cells. It is also useful for producing differentiated cells from neural ectoderm cells. The method can consider the neuron of neuroectoderm cells in vitro in concrectederm cells from neuroectoderm cells in vitro in concrectederm cells from also be used for producing concreted disease, including Parkinson's disease, concretederm cells from the cells can be used in the concrete particular diseases, including Parkinson's disease, concretederm cells produced by the method are used for transplant. Neural concreted mentors and Schwann cells produced by the method are used for the transmit of confidered method are used for the transmit of confidered method are used for the method are used for the method are used for the particular of method are used for the transmit of method are used for the method ar
                                                                                                                                                                                                                            Producing neuroectoderm cells for treatment of Parkinson's and Alzheimer's and for transplantation comprises culturing early primitive ectoderm-like cells in conditioned medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

MDZ3, New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 1907; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome 7g22.1, MD24 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 15g26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic

acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes ar useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                         Gaps

MDZ3 New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 1906; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome FQ22.1, MD24 is encoded at chromosome FQ22.1, MD24 is encoded at chromosome 16pl.1.2 and MD212 is encoded at chromosome 16pl.1.2 and MD212 is encoded at chromosome 16pl.1.2 and MD212 is encoded at chromosome 16pl.2 sequences are useful in therapy, continuated with decreased or increased expression or archivity of MD23, associated with decreased or increased expression or activity of MD23, continuated with decreased or increased expression or activity of MD23, consect or developmental disorders. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212. The nucleic useful in constructing microarrays for measuring gene expression. The proteins are useful as therapoutic agents for gene therapy or as proteins are useful as therapoutic agents for gene therapy or as

This invention relates to a novel method for the detection, treatment and/ or prevention of callular debilitations or derangements caused by the development of sporadic basal cell carcinoma (BCC). Specifically, it refers to the identification of relevant theirapeutic agents based on their effect on the expression level and activity of the Glil or transsription factor gene. Glil is a proto-oncogene that is ectopically expressed in epidermal tissue and is linked to tumour formation and neoplasia. The present invention describes cytostatic Glil inhibitors that are useful for detecting the onset or presence of sporadic BCC in an animal. Furthermore, it includes methods for testing the ability of a nituy or other entity to endulate the activity of Glil. This oligonucleotide sequence is the RT-PCR primer Shh-D used to amplify human Shh (secreted sonic hedgehog) RNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Upstream activating sequence; transgenic animal; regulatory DNA sequence; hedgehog gene; bigenic animal; transcriptional activating sequence; disease model; cancer; altered vascularisation; brain size regulation; autoimmune disease; tissue proliferation; Parkinson's disease; Shh;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preventing or treating sporadic basal cell carcinoma by administering an inhibitor of glioma transcription factor-1 (Gli1) activity or expression, and diagnosis of the disease by detecting the presence and level of expression of Gli1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a method of detecting the onset or presence of sporadic basal cell carcinoma (BCC) in an animal. The method involves measuring the level of Gili in a sample of Skin. Gili levels above basal or normal indicate the presence or onset of sporadic basal cell carcinoma. Gili is a zinc finger transcription factor down stream of secreted sonic hedgehog (shh) activation in a cascade of cytoplasmic signal transduction. Gili in turn can induce Shh expression in an autoregulatory manner. There are links between ectopic expression of the Gili gene and the development or onset of BCC. The method is useful for detecting the onset or presence of sporadic basal cell carcinoma, particularly in detecting skin cancer. The present sequence represents a PCR primer specific for human Shh cDNA. The primer is used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting the onset or presence of skin cancer, particularly sporadic basal cell carcinoma, comprises measuring the level of Glil in the

the invention

```
This sequence represents a PCR primer for the mouse Shh gene. The invention relates to a transgenic non-human animal (A) whose cells contain a non-viral regulatory DNA sequence (I) (e.g. an upstream activating sequence) linked to a recombinant hedgehog gene (II), which was introduced into the mammal, or its ancestor, at an embryonic stage. Bigenic animals (A'), derived from (A) by introducing a transcriptional activating sequence (TAS), are useful as models of disease, particularly cancer (of breast, skin, prostate, kidney, lung, or central nervous system, also primitive neuroectodermal tumours and medulloblastomal. CC cancer (of breast, skin, prostate, kidney, lung, or central nervous crarget genes on signaling pathways involving hedgehog proteins (HP) (e.g. altered vascularisation, regulation of brain size, density and cellular pathways involving hedgehog proteins (HP) (e.g. altered vascularisation, regulation of brain size, density and cellular pathways involving for a temporal requirement for HP in disease progression (particularly of cancers and autoimmune disease). The animals can be used to screen for potential therapeutic proliferation and differentiation. Hedgehog proteins can also be used to expand a population of neural stem cells from a subject, then the cells consistent of the subject, specifically for treatment of Parkinson sor and the silent transgenes in progeny from a simple cross since the transcription activator and the silent transgene are maintained in separate mouse lines, and abnormal expression consistent embryon and genotypic screening for each experiment, and many microin embryon and genotypic screening for each experiment, and many microin embryons and many procession experiment.

The present invention describes the rat Nurrl coding and protein sequences. The Nurrl protein is involved in the induction of tyrosine Approxylase expression in adult rat-derived hippocampal progenitor cells. The Nurrl gene and protein can be used in the treatment of catecholamine-related diseases such as Parkinson's disease, manic depression and schizophrenia. They can also be used to induce tyrosine hydroxylase expression and identify tyrosine hydroxylase related deficiencies, which are linked to the same diseases. The present sequence is a PCR primer used in a method to differentiate adult neural progenitor cells

Sequence 21 BP; 2 A; 7 C; 5 G; 7 T; 0 U; 0 Other;

Cell comprising exogenous nucleic acid inducing tyrosine hydroxylase expression useful for treating catecholamine-related diseases such as Parkinson's disease, manic depression and schizophrenia.

New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 1904; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is concoded at chromosome fg21.2, MD27 is encoded at chromosome fg21.2, and MD212 is encoded at chromosome is foll.2 and MD212 is encoded at chromosome is foll.2 and MD212 is encoded at chromosome is 5g26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MD23 ymD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are protein are useful as therapeutic agents for gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.

Use of a modulator of Hedgehog signaling pathways for treating T-cell mediated disease or infection and diseases associated with increased or decreased T-cell apoptosis and T-cell proliferation.

The invention relates to use of a modulator of a Hedgehog signalling pathway or a modulator of a target of the pathway in the preparation of a medicament for treating T-cell mediated disease or infection or a disease or disorder associated with increased or decreased T-cell apoptosis and for modulation or the Notch signalling pathway in cell apoptosis, and for modulation of the Notch signalling pathway in cimume cells. The modulator is useful for treating cancer of the breat, prostate or ovary, lymphomas and carcinomas, autoimmune diseases such as systemic lupus erythematosus, multiple sclerosis and diseases such as opposite or proliferative disorders such as obtending and crohn's disease, inflerative disorders such as atherosolerosis and psoriasis, viral infections such as AlDS and herpesviruses, genetic immunodeficiencies, carcodegenerative diseases such as Alzheimer's disease and Parkinson's disease, myelodysplastic syndromes such as aplastic anaemia, isochamic cirrhosis and wasting diseases such as plastic induced diseases such as carcheria this sequence represents increased a reverse transcriptase PCR (RT-PCR) primer used in the scope of the Example 10; Page 110; 154pp; English.

encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 15p11.2 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease acids and proteins are also beful for diagnosing or monitoring a disease acids and proteins are also beful for diagnosing or monitoring a disease acids and bo be used as probes to detect and characterize gross alterations in MDZ3, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 114707; 9pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect manch, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms,

or family members of a gene and a cross-species comparison. Bach of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening CDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence.html

New rat connective tissue growth factor, its related gene and antisense sequences useful for modulating CTGF and treatment of cell proliferative disorders. 

Example 1; Page 37; 55pp; English.

PCR primers AAA15463-64 were used to amplify DNA encoding a rat connective tissue growth factor (CTGF) polypeptide. The polypeptide may blay a significant role in the normal development, growth and repair of mammalian tissue. Antisense sequences can be used to inhibit the expression of CTGF in a cell. In particular, the antisense sequences are useful for ameliorating cell proliferative disorders associated with CTGF, e.g. overgrowth of cells, e.g. connective tissue cells. The regulation of CTGF activity comprises down-regulation. The disorders, which can be treated, are chosen from soleroderma, arthritis, cirrhosis, hepatic fibrosis, renal fibrosis, atherosclerosis, cardiac fibrosis, adhesions and surgical scarring. The amisense sequences can also be used to detect expression of CTGF in a sample

PCR primers AAZ99759-60 were used to amplify a 558 bp of the connective tissue growth factor (CTGF) gene. The specification describes methods for treating or preventing fibrosis or a renal disorder associated with overproduction of extracellular matrix, by administering to a subject an agent that modulates, regulates, or inhibits the expression or activity of CTGF, Healthy individuals demonstrate consistently low levels of urinary CTGF, while in patients with kidney disease the mean level of CTGF increased 4-fold. In those patients with diabetes, but as yet undiagnosed kidney disease, a similar increase was seen. The methods and agents are useful for diagnosing, treating or preventing fibrosis, diabetes, hypertension or a renal disorder associated with overproduction of extracellular matrix
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Diagnosing, treating or preventing fibrosis, diabetes or a renal disorder associated overproduction of extracellular matrix comprises administering an agent which modulates/inhibits the expression/activity of connective

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its correct match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, and an monitoring gene expression levels by hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis compounds. The nucleic acid probes are specifically designed for marked compounds. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring compenses are attached to a solid support. The analysis comprises monitoring compenses are attached to a solid support. The analysis comprises monitoring can eamily members of a gene and a crose species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes in mapping the 5' termini of mRNA molecules by complete acide any gene, in mapping the 5' termini of mRNA molecules by conference and previously sequenced. The sequence or subclones containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the concleic acid probes incorporated in the microarray. Note: The sequence cata for this patent can also be obtained in electronic format directly concleic acid probes incorporated in the microarray. Note: The sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 4.0%; Score 17; DB 1; Length 25; 80.0%; Pred. The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in bybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring of mucleic acid probes and a gene and a gross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes in situ hybridisation, in Southern, Northern or dotablot hybridisation to identify or detect the sequence or specific or additional subclones containing segments of DNA that have been for additional subclones containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly containing the formal previously sequence. The first containing the formal previously sequence them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 25 BP; 5 A; 8 C; 9 G; 3 T; 0 U; 0 Other;

Modified hedgehog protein, useful in the treatment of Parkinson's disease and Huntington's chorea, comprises a polymer containing a polyalkylene glycol group linked to any residue other than the N-terminal and lysine residues.

Example 6; Page 77; 157pp; English.

increased thermal stability would be an advantage when formulating the hedgehog protein in powder form. The present sequence represents a human Sonic hedgehog mutagenic primer used in an exemplification of the protein of the invention to cross the blood-brain barrier, and an nvention

The invention relates to the use of an active agent stimulating the expression and/or function of serum response factor (SRP). SRP variants and/or members of the SRP signal transduction pathway in eukaryotic cells for the preparation of a therapeutic drug or a pharmaceutical composition for the treatment of disturbances or illness such as tumour invasion, tumour metastasis, auto-immune diseases, disturbances of would healing, lymphocyte homing and disturbances of immune defense mechanisms that are linked with SRP- related cellular malfunctions. Pharmaceutical compositions of the invention are used in treating diseases associated with expression or misexpression of SRP target gene, which include formation of diseases like metastatic cancer which is influenced by the gene uph-R, diseases like chronic renal failure, cancer and various hypoglycaemias. The present sequence is Shh specific reverse transcription PCR (RT-PCR) primer used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of active agent stimulating expression of serum response factor, its variants or components of signal transduction pathway of factor in eukaryotic cells, for treating disturbances or illness e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                         tumour invasion; tumour metastasis; auto-immune disease; would healing; lymphocyte homing; immune defense mechanism; chronic renal failure; cellular malfunction; metastatic cancer; illness; hypoglycaemia; RT-PCR, Shh; reverse transcription PCR; primer; ss.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD24, MD24, MD212, MD212. MD23 is cancded at chromosome 7422.1, MD24 is encoded at chromosome 6721.2, MD27 is encoded at chromosome 6721.2, MD27 is encoded at chromosome 16011.2 and MD212 is encoded at chromosome 16011.2 and MD212 is encoded at chromosome 5921.3-22.2, MD27 is encoded at chromosome 16011.2 and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder sessociated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, or analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of hybridisation are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis of nucleic acid for family members of a gene and a cross-species comparison. Each of the nucleic acide further comprises a tag sequence. The array of nucleic acide further comprises a tag sequence. The array of nucleic acide further comprises a tag sequence. The array of nucleic acide further comprises a tag sequence or specific.

Diot hybridisation to identify or detect the sequence or specific or additional subclones on in screening cDNA or genomic libraries or subclones for additional subclones containing sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence attached and previously sequenced in the microarray. Note: The sequence is received and compared to the microarray. Note: The sequence attached and previously sequenced in the microarray. Note: The sequence attached and sequence or also be obtained in electronic format directly and sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                   EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human; cross-species comparison.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

```
The present invention relates to nucleic acid sequences that are complementary to particular genes, and can be used as probes for a variety of analyses such as gene expression analysis. Each probe comprises 9 or more consecutive nuclectides from at least one of 14936 nuclectide sequences defined in the patent, or their perfect sense match, sense mismatch, antisense match or antisense mismatch oligonuclectides. The probes may be used in a array comprising at least 10 distinct nucleic acid probes. The array is useful in monitoring gene expression nucleic acid probes. The array is useful in monitoring gene expression the probes and in hybridisation to a DNA library, in analysing genetic cuseful for identifying family members of a gene. The probes are also useful in in situ hybridisations, in screening cDNA or genomic libraries (or derived subclones) for additional clones containing segments of DNA that have been previously isolated and sequenced, in Southern, northern, or dot-blot hybridisation of genomic DNA to identify or detect the sequence of any gene or detect specific mutations in any gene, and in mapping the 5' termin of many molecules by primer sextensions. The sequences of the invention are also useful as PCR primer complementary to particular genes with a wide range of analytical uses. Complemented for this patent was obtained in electronic format the sequence data for this patent was obtained in electronic format directly from the USPITO web site at sequences of the invention. Note:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New probe array useful e.g. for monitoring gene expression levels, for analyzing genetic variations, or for hybridizing tag-labeled compounds, comprises multiple nucleic acid probes.

DNA target sequence #2490 useful in array for genetic analyses

The invention relates to a specific binding member which binds to human ectaxin. The binding member comprises an antibody variable heavy (VI) domain from CAT-212 (WIV) domain and a VH/VL (OMB) Variable light (VI) domain from CAT-212 (WIV) domain and a VH/VL (CDRs). Ectaxin is a chemoattractant protein that binds to a specific receptor which is expressed predominantly on eosinophils. The binding member is useful for neutralising ectaxin, which is useful in treating asthma, eczema and other atopic diseases such as rhinitis, food allergy, conjunctivitis, allergic colitis which are recognised as eosinophil-mediated diseases, for treating skin and other atopic conditions such as poriasis, pemphigoid, wells' syndrome, cellulitis, drug eruptions; inflammatory bowel disease which includes eosinophilic colitis/enteritis/ syndrome. The present sequence is a PCR primer used for converting encoding human antibody CAT-212 (ScPv-single chain variable region fragment) to IgG DNA (whole antibody) format Human, eotaxin; CAT-212; antibody; heavy chain variable region; VH; eczema; asthma; atopic disease; dermatological; rninitis; food allergy; vasotropic; conjunctivitis; allergic colitis; psoriasis; pemphigoid; eosinophil-mediated disease; cellulitis; drug eruption; vasculitis; inflammatory bowel disease; gastroenteritis; PCR primer; se. Human antibodies against ectaxin useful for treating asthma, eczema and other atopic diseases, comprises an antibody variable heavy or variable light domain from CAT-212 or from complementary determining regions. primer X2R for detection of Fragile E site. PQ R Fragile E site; diagnosis; microcapillary electrophoresis; human; trinucleotide repeat; screening; PCR; primer; 88.

Homo sapiens.

WO2003014396-A1

```
The present invention relates to a method for diagnosis of a multiplication disease of repeated trimucleotide sequence. The methods involves amplification of the repeated trimucleotide sequence by PCR, analysis of the amplified product on microcapillary electrophoresis (CE), analysis of the amplified product. In Fragile E site (FRAKE), in the size of the amplified product. In Fragile E site (FRAKE), in the all the size of the amplified product. In Fragile E site (FRAKE), in the healthy subjects and over 200 times in affected individuals. The present sequence is that of reverse primer X2R which is specific to the FRAKE repeated trimuclactide sequence region. It is used with forward primer X2R (see ABZ58546) to detect FRAKE. A diagnosis kit comprising these primers is claimed. In a healthy subject, a PCR product of 151 bp is produced. Use of CE, especially fabricated as an on-chip analysis system, allows the size of the PCR product to be measured rapidly, with accuracy and reproducibility. The method allows diagnosis before the disease cornot. It can be applied as a general screening test
                                                                                                                                                                                                                                                                       Diagnosing multiplication disease of repeated trinucleotide sequences e.g. Huntington's disease, by amplifying repeated trinucleotide sequence region, migrating and separating product by microcapillary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 22 BP; 4 A; 7 C; 8 G; 3 T; 0 U; 0 Other;

Mao Y,
```

```
The present invention provides sequences of antisense oligonucleotides targeted at the murine and human B7-1 and B7-2 coding and mRNA sequences. The antisense sequences have phosphorothicate backbones and some nucleotides are 2'-methoxyethoxy residues. The sequences can be used in the treatment of inflammatory and autoimmune disorders, including asthma, inventle diabetes mellitus, myasthenia gravis, Graves' disease, rheumatoid arthritis, allograft rejection, inflammatory bowel disease, multiple sclerosis, psoriaals, systemic lupus erythematosus, contact dermatitis, rhinitis, allergies and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel compound for diagnosing, preventing and treating immune disorders, comprising an oligonucleotide that specifically hybridizes with a nucleic acid sequence encoding B7 protein.
(systemic) lupus erythematosus, multiple sclerosis, contact dermatitis, rhinitis, allergy, cancer and metastases. The oligonucleotides may also be used to manipulate T cell activation ex vivo; to determine or detect B7 protein expression; for diagnosis; as assay and purification reagents and to study physiological roles of B7 proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, mouse; B7-1; B7-2; antisense; PCR primer; inflammation; autoimmune disorder; phosphorothioate backbone; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The oligonucleotides which specifically hybridise to B7 modulate its expression (and thus T cell activation and proliferation). This is particularly useful for treatment and prevention of inflammation and autoimmune diseases, e.g. asthma, (juvenile) diabetes, myasthenia gravis, Grave's disease, rheumatoid arthritis, allograft rejection, psoriasis,
                                                                                                                                                                                The invention relates to a novel mastocyte-specific guanine trinucleotidase 17.49. The protein is useful for treating diseases such as cancer and HIV infection. The current sequence represents a primer related to the mastocyte-specific guanine trinucleotidase 17.49 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligo:nucleotide(s) that modulate expression of B7 proteins - used for, e.g. controlling activation and proliferation of T cells, particularly for treatment, diagnosis and prevention of inflammation.
                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to antisense compounds, compositions and methods antisense computations the expression of calreticulin. The compositions comprise antisense compounds, particularly antisense oligonucleotides, targetted to nucleic acids encoding calreticulin. The antisense compound is useful for inhibiting the expression of calreticulin in human calls or tissues. It is also useful for treating a human having a disease or condition associated with calreticulin, e.g., hyperproliferative disorder e.g. cancer, autoimmune disease, viral infection or cardiovascular disease, by inhibiting expression of calreticulin. It is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. It is also used in antisense therapy. The present sequence is an antisense compound targetted to human calreticulin. This sequence is used to study the antisense inhibition of calreticulin expression-phosphorothioate 2'-MOE gapmer oligonucleotides

junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therappy. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of cof, or reducing sensitivity to adenosine, reducing levels of denosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

New compound having a sequence targeted to a nucleic acid encoding Transforming growth factor beta-receptor II, useful for preparing a composition for treating hyperproliferative disorder e.g., lung, liver, colon or gastric cancer.

Claim 3; SEQ ID NO 147; 141pp; English.

The invention comprises antisense oligonucleotides that are targeted to the nucleic acid encoding transforming growth factor beta (TGF-beta) receptor II. The antisense oligonucleotides of the invention are useful for treating: hyperproliferative disorders (e.g. breast cancer), or an autoimmune disorder (e.g. rheumatoid arthritis). The present DNA sequence

represents a 2'-O-methoxyethyl gapmer oligonucleotide with a phosphorothioate backbone that is targeted to mouse TGF-beta receptor II. Sequence 20 BP; 4 A; 7 C; 5 G; 4 T; 0 U; 0 Other; 88866

Treating an inflammatory skin disorder such as psoriasis comprises topically applying an antisense compound targeted to the nucleic acid encoding human B7 protein.

Example 1; SEQ ID NO 26; 88pp; English.

The invention relates to a method of treating an inflammatory skin disorder in an individual by topically applying an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention is for treating an inflammatory skin disorder in individual. The skin disorder is psoriasis, contact dermatitis, atopic dermatitis, seborrheic dermatitis, nummular dermatitis, generalised exfoliative dermatitis or eczema. The invention effectively modulates critical costimulatory molecules such as the B7 protein. The present sequence represents a human B7-1 targeted oligonucleotide.

A method has been developed for detecting T-cell activation by evaluating the amount of MUC-1 mucin expression in a T-cell compared to a non-darded control. The method is useful for treating disorders associated with T-cell activation, using an agent intrody/antagonist) that modulates MUC-1 activity. The T-cell activation associated disorders may be utoimmune or inflammatory disorders (e.g. inflammatory arthritis, portasis, allergies, allergic contact dermatis, rhemmatoris and arthritis, psoriasis, allergies, allergic contact dermatis, ankylosing spondylitis, myasthenia gravis, systemic lupus erythematosus, poblyarteritis nodosa, Goodpastures syndrome, isopathic thrombocytopenic purpura, autoimmune haemolytic anaemia, Grave's disease, rhemmatic fever, permicious anaemia, insulin-resistant diabetes mellitus, bullous permicious anaemia, insulin-resistant diabetes mellitus, bullous pemphigus vulgaris, viral myocarditis (Cocksakie B virus response), autoimmune thyroiditis (Hashimoto's disease), male infertility (autoimmune), sarcoidosis, allergic encephalomyelitis multiple scherosis, Sjorgens disease, Reiter's disease, Celiac disease, cancer. The present sequence represente a PCR primer for human MUC-1, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting T-cell activation by measuring the amount of MUC-1 expression useful for diagnosing or treating autoimmune or inflammatory disorders, viral disease or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; MUC-1; detection; T-cell activation; mucin; antiinflammatory; immunomodulator; antixheumatic; antiathritic; antiallergic; dermatological; antidabetic; nephrotropic; antithyroid; antianaemic; neuroprotective; hepatotropic; uropathic; ophthalmological; antiviral; cytostatic; autoimmune disorder; inflammatory disorder; viral disease;

```

Use of agent capable of intracellularly inhibiting mucin MUC-1 for inducing T-cell-based immunosuppression and for treating autoimmune disorders, transplant rejection and inflammatory disorders.

```
The present sequence is a PCR primer for the human muc-1 mRNA. It was used to amplify the sequence in order to determine the expression pattern of the protein. This showed that MUC-1 is a fimunosuppressor, and its antagonists act to reduce overactive immune responses. Thus, MUC-1 required to treat inflammatory disorders such as rheumaticia arthritis, psoriasis, allergic contect dermatitis and ankylosing spondylitis, autoimmune disorders including myasthenia gravis, systemic lupus erythematosus, polyarteritis nodosa, Goodpastures syndrome, isopathic thrombocytopoenic purpura, autoimmune haemolytic anaemia, Graves' disease, rheumatic fever, pernicious anaemia, insulinersistant myocarditis, autoimmune thyroiditis, male infertility, sarcoidosis, viral myocarditis, autoimmune thyroiditis, male infertility, sarcoidosis, allergic encephalomyelitis, multiple sclerosis, Sjorgens disease, and primary cirrhosis, immune disorders, graft versus host disease and

                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides the protein and coding sequences of several polymorphic variants of the human immunoglobulin E receptor beta chain (IGERB). These contain single nucleotide polymorphisms (SNPB) which may be indicative of a predisposition to atopy, allergy, asthma, rhinitis and eczema. Also provided are the sequences of probes and primers for use in identifying the genotype of an individual with regards to the IGERB gene. The IGERB gene is found at human chromosome 11q13. The sequences are all useful in therapeutics. The present sequence was used to isolate
Human; immunoglobulin E receptor beta chain; IGERB; chromosome 11q13; allergy; asthma; rhinitis; eczema; single nucleotide polymorphism; SNP; atopy; probe; PCR primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gene construct; genome modification; higher plant; plant; marker gene; homologous recombination; cloning site; T-DNA; plant transformation; monocotyledon; Agrobacterium; gene function analysis; PCR primer; ss.

The present invention describes a gene construct (1) for modifying the genome of higher plants by homologous recombination. (1) comprises marker genes and cloning sites between the right bottom sequence (BR) and left bottom sequence (BR) and left in the sequence (BR) and left constructs, particularly with a first cloning site for integration into the 5' region in the monologous recombination of the target gene into the 5' region in the homologous recombination of the target gene into the 3' region in the homologous recombination of the target gene into the 3' region in the homologous recombination of the target gene into the 3' region in the homologous recombination of the target gene into the nest genome, and a second cloning site for integration into the bost genome, and (2) producing a genome-modified higher plant (especially a monocotyledon) by using homologous recombination comprising (1) infecting plant cells, tissues or calluess with the Agrobacterium, (11) infecting plant cells, tissues or calluess produced by homologous recombination through negative or positive selection; (iv) culturing selected cells or tissues into calluess; (v) culturing in callue. Regenerating medium to grow into heterozygously modified plants; and (vi) producing homozygously modified plants; and (vi) producing homozygously modified plants; are useful for modifying the genome of higher plants by monologous recombination without altering the original locus, for the analysis of genomical dynamics. The present sequence represents a PCR primer which is used in an example from the present invention
                                                                                                      A gene construct for modifying the genome of higher plants by homologous recombination without altering the original locus, comprises marker genes and cloning sites between the right and left bottom sequences from T-DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cancer; anti-ckel; antisense oligonucleotide; benign lesion; papilloma; atherosclerosis; psoriasis; autoimmune disease; bacterial infection; viral infection; HIV; hepatitis; herpes; polythemia; mastocytosis; cksl inhibitor; skp2 inhibitor; cytostatic; antisense therapy; sarcoma; leukaemia; Hodgkin's lymphoma, non-Hodgkin's lymphoma; adenoma; melanoma; carcinoma; colon cancer; pancreatic cancer; cervical cancer; human; Skp2;

The present invention describes a method for treating cancer comprising using an anti-cks1 antisense oligomucleotide. Also described: (1) treating benign lesions (e.g. papillomas, atherosclerosis and psoriasis), autoimmune diseases, bacterial infections, viral infections (e.g. HIV infections, hepatitis or herpes infections), polythemia, or mastocytosis using the cks1 antisense oligomucleotide or as skp2 inhibitor; (2) treating cancer using a skp2 inhibitor; (3) cks1 inhibitor; (4) a ribozyme, a protein, a polypeptide, an antibody or a small molecule; (4) in solated polynucleotide with a sequence comprising a transcriptional initiation region and a sequence encoding an antisense oligomucleotide; (5) a recombinant vector comprising the polynucleotide; and (6) inhibiting the expression of cks1 or skp2 in a mammalian cell. cks1 and csn be used in antisense therapy, and as Cks1 and Skp2 inhibitors. The method is used in antisense therapy, and as Cks1 and Skp2 inhibitors. The method is used in antisense melanomas, carcinomas, colon cancer, pancreatic cancer, or cervical cancer. The present sequence represents an antisense oligomucleotide given in the Sequence Listing of the present invention. Treating cancer, e.g. sarcoma, leukemia, (non-)Hodgkin's lymphoma, adenomas, melanomas, carcinomas, colon cancer, pancreatic cancer or cervical cancer, by employing an anti-cks-1 antisense oligonucleotide. Determining the presence of neoplastic molecular markers, by identifying the presence of markers in host test sample using array of neoplastic molecular marker specific reagents and analyzing the array of the reagents

21; 41pp; English. Page ; Example 1;

Shamoon BF

Jefferson AB,

븅 The present invention relates to a method for determining the presence oneoplastic molecular markers in a host, involving the use of neoplastic molecular marker specific reagents to detect such markers and analysing the array of reagents, allowing the identification of the meoplastic disease present. This can be used to determine the best treatment for cancers, in particular neural cell, lung and prostate tumours. The present sequence is a PCR primer useful for detecting the coding sequences of markers of the invention ####X#X00000000X8

p53-dependent apoptosis-associated protein and its encoding gene p53AIPI, used for screening apoptosis mediated remedies for cancer and as controllers of apoptosis induction.

Example 7; Page 40; 121pp; Japanese.

The invention relates to human p53-dependent apoptosis-associated protein, P53AIPI comprising fully defined 806, 777, 2659 nucleotide sequences (ABL54631-ABL54633 respectively) given in the specification and proteins having fully defined 124, 86 and 108 amino acid sequences (ABB08837-ABB08839 respectively) given in the specification. The protein and encoded gene have cytostatic activity, are useful in screening for regulators of apoptosis for subsequent use as cancer treatments. The present sequence is that of the Human p53AIPI associated PCR primer, useful to the invention

The present invention relates to an expression library comprising synthetic nucleic acid sequences, not cloned from an immunized source, where the nucleic acid sequences are derived from an mutagenised immunoglobulins that are naturally devoid of light chains. The library is useful for the preparation of antibodies having binding specificity for a target antigen which avoids the need for a donor to have been previously immunized with the target antigen. The recombination of heavy and light chains is avoided, therefore preventing the formation of molecules that are non-functional. The number of hypervariable residues in the binding domain is reduced, allowing a more complete repertoire of possible binding variants to be obtained. The present sequence is a PCF primer targeted to anchor regions in Ilama antibodies. The primers (AAA73745 to AAA73745 amplified the framework regions H, P2, P2, P2, P3 and P4. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Expression library comprising nucleic acids not cloned from an immunized source, derived from immunoglobulins naturally devoid of light chains, use for producing antibodies specific for a target antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Heavy chain; tetanus; toxin; human; monoclonal; antibody; K4.1; hybridoma; immortalisation; in vivo; xenomice; analysis; immunoglobulin; diagnosis; research; therapy; B cell; primer; polymerase chain reaction; amplification; PCR; ss.

The invention relates to modification of the half-life of an antibody.

The method of the invention comprises physically linking an antibody which contains an FCRn receptor binding molety, (hinge, CH2 and CH3 contains an FCRn receptor binding molety, (hinge, CH2 and CH3 molecules are protected from degradation by the endosomal FCRb/FCRn receptors, which gives them a relatively extended serum half-life or an antibody by increasing molety further extends the serum half-life of an antibody By increasing molety further extends the serum half-life of an antibody by increasing che serum half life of an antibody by increasing clinical treatments is lowered. This could significantly lower costs for treatment, and lead to less frequent hospital visits as fewer doses are required, thereby increasing the quality of life for patients, and potentially reducing the likelihood of toxicity. The technology can also be adapted to extend the serum half life of other proteins, in addition to antibodies. Sequences AAA66862-A66863 represent PCR primers used in an exemplification of the present invention to amplify cDNA generated from human monocolonal antibody poly(A+) mRNA expressed in XenoMice. The PCR products were then cloned into pCRII and sequenced
                                                                                  Modifying antibody half life by linking the antibody to an FcRn binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytotoxic T-lymphocyte antigen-4; CTLA-4; antibody; immune system; hyperimmunity disorder; autoimmune disease; diabetes; graft rejection; proliferative disorder; cancer; immunodeficient disorder; PCR primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a primer for the PCR amplification of the CDNA encoding the heavy chain of the anti-teranus toxin (TT) human monoclonal antibody (MAD) K4.1, which was secreted by the hybridoma K4.1 and obtained by immortalising B cells from xenomice (containing integrated human DNA from the immunoglobulin locus) immunised with TT. The MAD can be used for analysis, diagnosis, research and therapy, particularly for human therapeutic, and in vivo diagnostic applications

```
The invention relates to a novel chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40. The anti-CD40 antibody of the invention demonstrates cytoatatic, virucide, antibacterial, immunossimulant and anti-HIV activities and may be useful for treating a hyperproliferative disorder such as cancer, viral and bacterial infection or genetic, primary or combined immunodeficiency conditions including neutropenia or HIV infection. The anti-CD40 antibodies may also be useful for detecting CD40 in a biological sample in vitro or in vivo, as well as during gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40, useful for enhancing an immune response in a human, or treating cancer, HIV, neutropenia or
                                                      The invention relates to an antibody that binds to an epidermal growth factor receptor (FGF-r) and exhibits inhibition of Expropriation of Exp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  anti-CD40 monoclonal antibody; CD40; cytostatic; virucide; antibacterial; immunostimulant; anti-HIV; hyperproliferative; cancer; viral; bacterial infection; immunodeficiency; neutropenia; HIV; gene therapy; human; PCR; primer; ss; universal; VH; MG-30.

                                                                                                                                                                                                                                                                                                                                  The present sequence represents a PCR primer which is used to amplify a fragment of the gene encoding a heavy chain of human antibodies against cytotoxic T-lymphocyte antigen (CTAA)-4. The specification describes an synthetic antibody which is capable of binding CTLA-4. The antibody is composed of a heavy chain variable region, comprising a modified contiguous sequence from a FRI-FRS sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to inhibit CTLA-4 and down-regulate the immune system to treat hyperimmunity disorders (e.g. autoimmune disease, diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to upregulate immune system to up-regulate immunodeficient disorders
                                                                                                                                  Novel antibodies capable of binding cytotoxic T-lymphocyte antigen (CTLA) -4 containing specified heavy and light chain sequences, useful for treating, e.g. immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Fully human monoclonal antibodies that bind to epidermal growth factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human epidermal growth factor receptor (EGF-r) antibody PCR primer #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

missing 5' sequence of cDNA encoding a novel canalicular multispecific organic anion transporter (cMOAT) protein, isolated from a human lambda gtil liver cDNA library. The protein is a new member of the ATP-binding cassette (ABC) transporter family. The ATP dependent cMOAT transporter system mediates hepatobiliary excretion in the liver. cMOAT may be a liver-specific homologue of multidrug resistance-associated protein. The nucleic acids are used to provide cells with cMOAT protein activity. CMOAT protein activity in cells can be enhanced by increasing the level of glutathions, glucuronide and/or sulphate. Antiesness constructs, especially derived from another multidrug resistance (WDR)-related protein, e.g. MDR-1, to the nucleic acids and vectors can be used to decrease the level of cMOAT in a cell. The nucleic acids and proteins can be used especially in diagnosis of Dubin-Johnson disease, Rotor disease or another disease involving cMOAT. The cMOAT gene may also be used as a selectable marker gene. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                        Canalicular multispecific organic anion transporter protein; for ATP-binding casette transporter family; ABC transporter; hepatobiliary excretion; multidrug resistance-associated protein; cMOAT protein activity; multidrug resistance-related protein; MDR-1; Dubin-Johnson disease; Rotor disease; PCR primer; ss.
                                                                                                                        used to isolate the missing 5' sequence of rat.cMOAT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA encoding human and rat canalicular multispecific organic transporter proteins - useful for diagnosis and treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 15; DB 1; Length 23;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The calpain large subunit 1 gene located on chromosome 15 codes for a calcium activated neutral protease (CANP3) belonging to the calpain family. Mutations in the gene induce limb-girdle muscular dystrophy (LGMD) 2 disease. The gene, and fragments of it, can be used in the prevention, treatment, diagnosis and detection of a predisposition to CAMP2 disease. Bight primers (AAT32456-63) were used to localise the calpain large subunit 1 gene. The results positioned the gene in a region previously defined as 15q15.1-q21.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human novel Calpain large sub:unit 1 gene encoding a calcium dependent protease - used to develop prods. for the diagnosis and treatment of limb -girdle muscular dystrophy 2 disease.
therapy procedures. The current sequence is that of the human anti-CD40 antibody-related PCR primer of the invention.

Use of benzoxazinone derivatives for treating a subject suffering from a disorder in glucose and lipid metabolism such as non-insulin dependant diabetes mellitus or obesity. WPI; 2002-082970/11.

Example 2; Page 34; 45pp; English.

The invention relates to benzoxazinone derivatives useful as peroxisome proliferator activated receptor (PPAR) gamma modulators. The invention daso relates to pharmaceutical compositions comprising benzoxazinone derivatives and methods for treating the onset of a disorder in glucose and lipid metabolism, preferably a condition of reduced insulin sensitivity such as non-insulin dependant diabetes mellitus (NIDDM), polycystic ovary syndrome (POCS), hypertension, ischaemia, stroke, heart diseases, irritable bowel disorder, inflammation and cataract. The present sequence is a probe designed to anneal to the aPZ mRNA and function in the bDNA mRNA decetion system. This probe used in the aPZ assay for antagonist which is used in the exemplification of the

```
The invention provides methods of treating a subject suffering from a condition associated with peroxisome proliferator activated receptor gamma (PpsAgamma) activity that involves administering a benzoxazinone compound of a specified formula to the subject. The method is useful for treating and inhibiting in a subject the onset of a condition associated with PpsAgamma activity such as a condition of reduced insulin sensitivity, non-insulin dependant diabetes mellitus, obesity, nephropathy, retinopathy, atherosclerosis, polycystic ovary girdrom, hypertension, ischemia, stroke, heart diseases, irritable bowel disorder, inflammation and cataract. Sequences AAI68004-023 represent oligonucleotide probes specific for ap2 used in ap2 mRNA assay for

```
This invention relates to a novel apparatus for monitoring biological interaction which comprises a substrate and a modified aptamer attached to the substrate, where a target molecule or its portion, contacted with the modified aptamer under conditions to allow formation of a complex between the modified aptamer and the target molecule or its portion, is detected. The invention may be useful in developing phosphorotrhioare agonists or antagonists which may have antibacterial, immunosuppressive, antitrheumatic, antiarthritic, antiinflammatory, cytostatic, anti-HIV, and apparatus of the present invention are useful for monitoring biological interactions and in functional proteomics. As an example, and apparatus of the present invention are useful for monitoring biological interactions and in functional proteomics. As an example, and apparatus of the present invention are useful for monitoring biological interactions and in functional proteomics. As an example, and apparatus of the present invention are useful for monitoring biological authritis, Crohn's disease, such as toxic shock, sepsis, returnating NF-kappaB aptamer-related diseases, such as toxic shock, sepsis, remained at third induced lung injury, general cancer, AIDS, human cutaneous T cell lymphoma, lymphoid mallghancies, HTM-1 induced adult T-cell leukaemia, atherosclerosis, cytomegalovirus, herpes simplex virus, JCV, SV-40, rhinovirus, influenza, neurological disorders and lymphomas. The present sequence is that of an oligomuclecide duplex which was used during the exemplification of the invention.
                                                                                                                                                                                                                                                                                              New apparatus with a substrate and a modified nucleotide aptamer for monitoring biological interactions, useful for diagnosing and treating NF-kB aptamer-related diseases, such as toxic shock, rheumatoid arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Seguence 23 BP; 1 A; 6 C; 11 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                     Gorenstein D,
The patent discloses 4h-Benzo(1,4) oxazin-3-one compounds which are useful as peroxisome proliferator activated receptor (PPAR) gamma agonists and antagonists. The invention also relates to compositions comprising such compounds and methods for treating or inhibiting the onset of a disorder in glucose and lipid metabolism, preferably a condition of reduced in sulin sensitivity, such as non-insulin dependent diabetes mellitus (NIDDM), obesity, atherosclerosis, nephropathy, neuropathy, retinopathy, polycystic ovary syndrome, hypertension, ischaemia, stroke, heart diseases, irritable bowel disorder, inflammation and cataract. The present DNA sequence is a probe which is designed to anneal to ap2 mRNA and function in the bDNA mRNA detection system. This probe is used in ap2 assay for antagonist in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                          Use of 4h-benzo(1,4)oxazin-3-one derivatives for treating a subject suffering from a disorder in glucose and lipid metabolism e.g. non-insulin dependant diabetes mellitus and obesity.

```

```
nucleic acid molecule encoding human mitochondrial phosphoenolpyruvate carboxykinase (also known as PBPCK-mitochondrial phosphoenolpyruvate carboxykinase (also known as PBPCK-mitochondrial) PBPCK-M; PCKS and murpEPECK), where the Oligonucleotide specifically hybridise with and inhibit the expression of human mtPBPCK. The antisense oligonucleotides can be used for inhibiting the expression of mtPBPCK in human cells or particularly a human suspected of having or treating an animal, particularly a human suspected of having or being prone to a condition or disease associated with expression of mtPBPCK. They can also be used in diagnostics and as research reagents in sandwich and other assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compound targeted to a nucleic acid molecule encoding human mitochondrial phosphoenolpyruvate carboxykinase useful for treating a human with a mitochondrial phosphoenolpyruvate carboxykinase-associated
amplify the ilvC gene, panE gene, panB gene, panC gene, panD gene and the avtA gene which are used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, mitochondrial phosphoenolpyruvate carboxykinase; PEPCK-M; PCK2; PEPCK-mitochondrial; mtPEPCK; antisense oligonucleotide; modulation; phosphorothioate; inhibition; diagnosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel method for the production, and improvement, of panthothenic acid (I)-producing microorganisms by amplifying (particularly overexpressing) sequences (I) that encode ketopanthoate reductase (XRP), specifically the pans gene, either individually or together. Optionally the ilvC gene is also amplified. (I) is a vitamin used in cosmetics, medicine and human or animal nutrition. The method provides increased yields of (I), e.g. 35-40 mug/ml for the most productive strains. AAA12160-A12171 represent PCR primers used to

                                                                                                                                                                                                    This sequence represents an antisense inhibitor of the invention, and inhibits the expression of the human G-alpha-13 protein. The antisense compounds of the invention are of 8 to 30 nucleobases in length, that inhibits the expression of the human G-alpha-13. The antisense compound is useful for treating an animal, particularly humans, having or being prone to a disease or condition associated with the expression of G-alpha-13, such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PCR primer; panthothenic acid; ketopanthoate reductase; panB gene; vitamin; cosmetic; medicine; nutrition; ilvC gene; panB gene; panC gene; panD gene; avtA gene; ss.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiliflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, receptor, producing proncholization, increasing levels of incr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condittion. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                              Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiatehmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.

The invention relates to a novel DNA vaccine for flatfish rhabdovirus (HIRRV) infected fishes, which provides immunity against HIRRV. The vaccination method uses a DNA construct comprising a transcriptional-control sequence containing cytomegalovirus immediate-type promoter, operably coupled to a nucleotide sequence encoding an immunogenic polyapeptide of HIRRV. The DNA vaccine has virucide activity. The HIRRV DNA vaccine is useful for administering to a fish belonging to the flatfish family by gene gun. The HIRRV DNA vaccine is useful for preventing HIRRV infected by HIRRV and is also useful for preventing HIRRV infection in flatfish. The HIRRV DNA vaccine is effective in enhancing immunity of fish infected by HIRRV. This effective in enhancing immunity of fish infected by HIRRV. This of polynucleotide sequence represents an oligo used in the analysis of the mRNA expression level from the muscles of flatfish, following an innoculation with the flatfish rhabdovirus vaccine of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA vaccine for flatfish rhabdovirus infected fishes has DNA construct comprising a transcriptional control sequence coupled to a nucleotide sequence encoding an immunogenic protein of flatfish rhabdovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

```
The present invention relates to the Thermus sp. AK16D DNA ligase enzyme. This thermostable ligase has 100 fold higher fidelity than T4 ligase and 6 fold higher fidelity than Thermus thermophilus ligase. The present sequence is the degenerate antisense primer #3 corresponding to amino acids 641-647 of the T.thermophilus HB8 DNA ligase gene. This primer was used to amplify DNA ligase gene fragments from various Thermus sprains. The high specificity and thermostability of Thermus sp. Ak16D ligase hasks it useful for use in ligase based linear signal amplification, known as LDR/PCK. Ligation of suitable oligomucleotide probes can be disrupted by hybridisation mismatches. This feature may be used to detect infectious diseases (for example bacterial, fungal or viral infection),
                                                    Degenerate primer #3 targeted to T.thermophilus HB8 DNA ligase gene
                                                                                                                                                                                                                                                                                                                                                                                                                                   New thermostable DNA ligase for sealing a ligation junction between oligonucleotide probes and the target sequence.
                                                                                     Thermostable ligase; bacterial; fungal; viral; infection; cancer genetic disease; PCR primer; antisense; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 20 BP; 1 A; 6 C; 2 G; 5 T; 0 U; 6 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 2; Page 24; 55pp; English.

AAT51423-T51415 represent amplification primers used in the construction of an E. coli hygromycin B phosphotransferase (hpt) gene containing vector of the invention. The vector these sequences were used to construct also contained a luciferase gene. The hpt gene used in the vector, is used as a dominant selectable marker. The hpt gene has preferably been modified, to provide increased resistance to hygromycin in comparison to the wild type gene. In the vector, the hpt gene has the control of a promoter (such as the GDP-2 promoter) that is native to Agaricus bisporus. The vector can then be used in the production of a starker, and donor DNA are integrated into the homobasidiomycetes, and expressed at a level which allows direct selection, and stable maintenance of the transformed cells. Previoually, the donor DNA was not both integrated and expressed at high enough levels for direct selection and stable maintenance to be possible. The transformed homobasidiomycetes can be used for the commercial production of substances, such as

enzymes and metabolites

Production of stably transformed homo-basidiomycetes - with altered genetic characteristics for e.g. commercial production of enzymes.

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viablity, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administrating to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms of the gene comment in the disense in the disquosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, permalignant metaplastic or dysplastic concers, benigh tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AZZSSB12-ZZSB25 represent thuman polymorphic sites described in the method of the invention
                                                                                                                     Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.

VARI-) VARIAGENICS INC

This invention describes a novel method for identifying an inhibitor of potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a consciou, by administering to the patient a first allele presencerous condition, by administering to the patient a first allele present in cells of the precancerous condition, where the normal somatic consistency of the precancerous condition, where the normal somatic consistency and patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene consent in a population and targets only one allelic forms present in the ormal somatic cells, and the first gene. The products and methods can be consent in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic censions, benigh tumours, endometriosis, polygostic kindrey disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent the man polymorphic sites described in the method of the invention Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease. Characterizing drug-target interactions and identifying genetic mutations that confer resistance to antibacterial compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a PCR primer for the coding sequence for enoylacrate (Tabl) from Neissaria gonorrheae. The protein was used to antibacterial compounds and understand how the target and compound and understand how the target and compound and interacts. This in turn is useful for identifying other antibacterial agents. The Fabl sequence is particularly useful for generating the Hamophilus influenzae, Streptococcus pureins of N. gonorrheae, Staphylococcus aureus, Streptococcus progenes, Peculomoniae, Actinobacter, E. coli, Staphylococcus aureus, Streptococcus progenes, Pseudomonas aeruginosa, Enterococcus faecium, Bacillus subtilis and Halloobacter pylori, Which can then be used to determine how to fight infection by these bacteria. This primer was used to create random mutations in the Fabl coding sequence. (Updated on 15-SEP-2003 to

                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                   ద
The specification describes recombinant respiratory syncytial virus (RSV) particles and viral vectors which express heterologous genes or mutated RSV genes. The RSV particles comprise a RSV antigenome or genome containing at least one functional deletion in an M2 gene, or encode antigenic polypeptides of both RSV-A and RSV-B, or contain a L gene mutation. The recombinant RSV particles can be used to produce vaccines, e.g. bivalent vaccine against RSV-A and RSV-B, or RSV and influenza. Recombinant RSV vaccines can also be constructed for viruses such as HIV-BL HIV-2 and HBV, by constructing a RSV comprising a heterologous sequence from these organisms. The present oligonucleotide was used to construct the ribozyme/T7 terminator sequence, which was construct vectors which are used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The specification describes recombinant respiratory syncytial virus (RSV) particles and viral vectors which express heterologous genes or mutated RSV genes. The RSV particles comprise a RSV antigenome or genome containing at least one functional deletion in an M2 gene, or encode antigenic polypeptides of both RSV-A and RSV-B, or contain a L gene mutation. The recombinant RSV particles can be used to produce vaccines, e.g. bivalent vaccine against RSV-A and RSV-B, or RSV and influenza. Recombinant RSV vaccines can also be constructed for viruses such as HIV-1, HIV-2 and HBV, by constructing a RSV comprising a heterologous construct the ribozyme/T7 terminator sequence, which was used to vectors which are used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Respiratory syncytial virus; RSV; viral vector; mutated RSV gene; HBV; RSV antigenome; functional deletion; M2 gene; RSV-A; RSV-B; antigen; L gene mutation; vaccine; bivalent vaccine; influenza; HIV-1; HIV-2; se.

The invention provides a novel in vitro method for the detection of microorganisms and viruses. The method comprises: (1) forming a comprises and viruses. The method comprises: (1) forming a comprision of a microorganisms and viruses. The mixture by compining a predetermined volume of a sample to be tested for the presence of a nucleic acid sequence comprising 5'-GATAAGACTCCAPAAGT-3', known amounts of a first primer comprising 5'-GATAAGACTCCAPAAGT-3', known amounts of a first primer of comprising 5'-GATAAGACTCCAPAAGT-3', and a second primer comprising 5'-GATAAGACTCCTAPACTCAC-3', and primer comprising 5'-GATAGACTCTAPAGCAC-3' to replicate and attain 0.25-10000mug nucleotide product Mun mixture; (3) adding a probe containing DNA comprising 5'-GATAGACTCTTAAGCCAC-3' to the nuclet acid sequence, if present, and change the conformation of the probe; and (4) determining whether or not bacteria are present in the sample by detecting the conformational change indicating the presence of bacteria in the sample. Conformational change indicating the presence of bacteria in the sample. The methods can be used for the detection of viruses and microorganisms, including bacteria, yeast, and in clinical disapposities. Using the method for and cosmetic industry and in clinical disapposities. Using the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detection of microorganisms and viruses, for use in the food and cosmetic industries and for clinical diagnostics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Including bacteria, yeast, molds and protista. They can be used in food and cosmetic industry and in clinical diagnostics. Using the mult is not necessary to remove non-hybridized probe from the system

                                                                                                                                                                                                                                                                                                                                   The present invention describes the rat Nurrl coding and protein sequences. The Nurrl protein is involved in the induction of tyrosine hydroxylase expression in adult rat-derived hippocampal progenitor cells. The Nurrl gene and protein can be used in the treatment of catecholaminerelated diseases such as Parkinson's disease, manic depression and schizophrenia. They can also be used to induce tyrosine hydroxylase expression and identify tyrosine hydroxylase related deficiencies, which are linked to the same diseases. The present sequence is a PCR primer used in a method to differentiate adult neural progenitor cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; variant thrombospondin 1; variant thrombospondin 4; SNP;

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various oblymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Infectious respiratory syncytial virus particle, useful for producing vaccines, comprises a viral genome or antigenome with a deletion in an

The invention describes an isolated infectious respiratory syncytial varias (RSV) particle with an attenuated phenotype comprisaling an RSV antigenome or genome, where the genome or antigenome has a heterologous sequence encoding a G and P protein, and a mutation in the M2-2 gene. The SKV particle is useful as expression vector or vaccine. This sequence represents an oligonuclectide used in the construction of leader and trailer sequences for creation and functional analysis of reporter
                                                                   Oligonucleotides AAF25449-59 were used to construct a ribozyme/T7 reminator sequence, which was then ligated to the ends of the CDNA of respirators requence, which was then ligated to the ends of the constrator syncytial virus (RNV). The specification describes an infectious RNV particle comprising an RSV (anti)genome that has at least one functional deletion in a virus accessory gene. Especially, the genome contains the reverse complement of a mRNA-encoding sequence linked to a polymerase-binding site (RBS) of an RSV. The RSV particles of the invention are useful for preparing attenuated, live vaccines, including those that express heterologous gene products (particularly from another strain of RSV, some other virus or pathogen, cellular protein or tumour antigen). Also negative-strand RSV RNA templates can be used to express heterologous gene products (e.g. viral proteins or ribozymes for prevention or treatment of disease) in cells and/or to rescue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated infectious respiratory syncytial virus particle, useful as a vaccine, has an attenuated phenotype comprising the viral genome that has a heterologous sequence encoding a G and F protein and a mutation in the

Also included are detecting oligodendroglia and their precursor cells capable of forming myelin (using as an indicator the expression of FC receptor gamma chain in the precursor cells), investigation of the expression of FC receptor gamma chain in the precursor cells), investigation of the expression of FC receptor gamma chain in animal brain tissue (by immune typing, cytochemical amalysis, gene amplification or Western blotting) and kits for these methods, containing anit-FC receptor gamma chain antibody or amplification primers. The drug is used for treatment and prevention of neurodegenerative diseases, and disorders of myelin formation, such as multiple solerosis, Krabbe's diseases, advenoledystrophy and multiple solerosis, Krabbe's diseases, advenolethodystrophy and metachromic leukodystrophy. The present sequence is an FC receptor III alpha gamma chain PCR primer used in the exemplification of the invention
plasmids and construction of a cDNA representing the complete genome of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PCR; primer; ss; Fc receptor gamma chain; neuroprotective; oligodendroglia; myelin; neurodegenerative disease; unlitiple sclerosis; myelin formation disorder; Krabbe's a disease; adrenoleukodystrophy; metachromic leukodystrophy; Fc receptor III alpha gamma chain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises a non-human animal model for demyelinating disease - in which myelinogenesis is inhibited by a defect of myelinogenesis signal molecules in oligodendrogila. The non-human animal model of the invention is useful for acreening for a myelin growth regulator, or for screening for a therapeutic agent which is useful for treating a demyelinating disease such as multiple sclerosis. The present DNA sequence represents a PCR primer that was used in an example of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Multipotent adult stem cell; MASC; cell replacement therapy; cytostatic; cardiant; cardiovascular; hepatotropic; haemostatic; antidiabetic; virucide; antiinflammatory; vasotropic; antianaemic; neuroprotective;
                                                                                                                                                                                                                                                                                                                                                                                                  Novel non-human animal model for demyelinating disease in which myelinogenesis is inhibited by defect of myelinogenesis signal molecules in oligodendroglia, for screening for therapeutic agent for multiple

                                                                                                                                                                                          inflammation.
                                                       22-AUG-2002.
```

The present sequence is a primer for a retrovirus long terminal repeat

(LTR). The primer was used in an example from the invention in which a
retroviral marking study was used to demonstrate that neurons, astrocytes
and oligodendrocytes can produced from a single bone marrow-derived
multipotent adult stem (MASC), which also differentiated into muscle and
addifferentiating MASC. The MASC are derived from a non-embryonic organ
or tissue, such as bone marrow, muscle, brain, umbilical cord blood or
placenta, and have the capacity to be induced to differentiate to a cell
type of mesodermal, ectodermal or endodermal origin, including
of mesolast, chondrocyte, adipocyte, fibroblast, marrow stroma, skeletal
muscle, smooth muscle, cardiac muscle, endothelial, pitter,
coffeeblast, chondrocyte, adipocyte, fibroblast, marrow stroma, skeletal
muscle, smooth muscle, cardiac muscle, endothelial, pitter,
coffeeblast, chondrocyte actian muscle, endothelial, spittelial, liver,
muscle, smooth muscle, cardiac muscle, endothelial, pitter,
coffeeblast, constitutively express oct4 and high levels of telomerase and are
negative for CD44, MHC class I and MHC class II expression. Teratomas are
not formed when MASC are administered to a patient. MASC or their progeny
are particularly useful for treating cancer, cardiacyascular disease,
coffeciency connective tissue disorders, autoimmuse disease,
degenerative or traumatic neurological conditions, autoimmuse disease,
degenerative or traumatic neurological conditions, autoimmuse disease,
pe directed to abdominal aortic aneurysm, cardiac bypass surgery,
peripheral vascular disease, or coronary vascular disease (all claimed).
(Updated on 07-AUG-2003 to correct OS field) (Updated on 29-AUG-2003 to
standardise OS field)

New multipotent adult stem cells that can be induced to differentiate to form a cell type of mesodermal, ectodermal or endodermal origin, useful for treating e.g. cancer, diabetes, hepatitis, hemophilia, ischemia or inflammation.

WPI; 2002-667000/71.

Example 10; Page 55; 117pp; English.

The present sequence is a primer for a retrovirus long terminal repeat (ITR). The primer was used in an example from the invention in which a retroviral marking study was used to demonstrate that neurons, astrocytes and oligodendrocytes can produced from a single bone marrow-derived multipotent adult stem (MASC), which also differentiated into muscle and differentiating masc, made marrow, muscle, brain, umbilical cord blood or placenta, and have the capacity to be induced to differentiate to a cell type of mesodermal, ectodermal or endockmal origin, including or tissue, such as bone marrow, muscle, brain, umbilical cord blood or placenta, and have the capacity to be induced to differentiate to a cell type of mesodermal, ectodermal or endockmal origin, including coteoblast, chondrocyte, adipocyte, fibroblast, marrow stroma, skeletal coteoblast, smooth muscle, cardiac muscle, endothelial, polithelial, liver, muscle, smooth muscle, cardiac muscle, endothelial, epithelial, liver, cot panoreas, haematopoletic, gllal, neuronal or oligodendrocyte cell types. MASC constitutively express oct4 and high levels of telomerase and are negative for CD44, MHC class I and MHC class II expression. Teratomas are cot farmed when MASC are administered to a partient. MASC or their progeny are particularly useful for trreating cancer, cardiovascular disease, car eadministered to a particinal conditions, autoimmune disease, desencative or traumatic neurological conditions, autoimmune disease, desence, transplant rejection, ischaemia or inflammation. Treatment may be directed to abdominal aortic aneurysm, cardiac bypass surgery, peripheral vascular disease, or coronary vascular disease (all claimed). (Updated on 07-MUG-2003 to correct OS field.) (Updated on 29-AUG-2003 to cytandardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to disganose usceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Single nucleotide polymorphism, SNP, human, genetic disease, disease susceptibility, cardiovascular system, endocrine system, neurological system, forensic testing, paternity testing, PCR primer, ss.

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in diesase diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose usceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and

                                                                                                                                                                     The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and

individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNBs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [11] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, chanded and segment encoding [1]. [1] can have antipsoriatic, and percention optical, wulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. [1] can be used in gene therapy. [1] and [1] are useful for treating proliferative skin diseases such as periasis, atopic dermatitis, actinic keratosis, also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing carring such as keloid, adhesion and whypertrophic or hypertrophic burn scar. AMH57577 to AMH62099 represent sequences used in the companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; WNE; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar; sickle cell retinopathy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                        Cell-cycle dependent kinase cdk8 ribozyme binding site SEQ ID NO:956.

The method comprises detecting a variant allele of at least 1 dopaminergic gene. Analysis of variant dopaminergic gene alleles may also differentiate between patients with MMA, and those with migraine without aura (MO) or other conditions, e.g. stroke, that produce similar symptoms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mouse C/EBP beta phosphorothioate antisense oligonucleotide, SEQ ID:127.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Assessing susceptibility to syndromes including migraine with aura, depression and anxiety - by detecting variant alleles in genes for dopaminergic receptors or transporter, also treatment using agents that antagonise binding of dopamine to these proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mouse; murine; C/EBP beta; CCAAT/enhancer-binding protein beta; C/EPB2; LAP, TCF5; CRP2; NFIL6; IL6DBP; NF-M; AGP/EBP; Apc/EBP; transcription factor; tissue development; cellular function; proliferation; differentiation; hormone responsiveness;

Sequences ABL94252-ABL94476 represent antisense oligonucleotides targeted to the human or mouse CCAAT/enhancer-binding protein alpha (C/BBP alpha) and which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human and/or mouse C/BBP alpha RNA, and were analysed for their effect on C/BBP alpha mENA levels of transcription factors which regulate the expression of a wide range of transcription factors which requiate the expression of a wide range of contranscription factors which requiate the expression of a wide range of contranscription factors which requiate the expression of a wide range of configuratily regulates hormone responsiveness and oxidative stress responses of primarily regulates hormone responsiveness and oxidative stress responses of primarily regulates hormone responsiveness and oxidative stress responses and is a mediator of IL-6 (interleukin-6) signalling, C/BBP beta is thought to be involved in carbohydrate metabolism, immunity, the Thi response, female ferrility and gluconeogenic pathways. C/BBP beta is thoughts to be involved in the liver, lung, spleen, kidney, brain, and testils, with the highest expression found in the lung. It is also expressed at a higher of elevated levels of glucose, indicating that it is involved in the conditions associated with C/BP beta expression, conditions are useful for diagnosis, prevention and treatment of manimum cancer), tunour formation, diabetes (particularly covarian cancer), tunour formation, diabetes (particularly covarian cancer), tunour formation, diabetes (particularly covarian cancer), tunour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel antisense compound targeted to nucleic acids encoding human or mouse CCAAT/enhancer binding protein (C/EBP) beta, useful in vitro for inhibiting expression of human or mouse C/EBP beta in cells/tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; Col 47-48; 69pp; English

Sequences ABL94252-ABL94476 represent antisense oligonucleotides targeted to the human or mouse CCAAT/enhancer-binding protein alpha (C/BSP alpha) gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human and/or mouse C/EBP alpha RNA, and were analysed for their effect on C/BBP alpha mRNA levels by quantitative real-time PCR. The C/EBP family of proteins are a family of transcription factors which regulate the expression of a wide range of genes that control normal tissue development, cellular function, cellular

proliferation and functional differentiation. C/EBP beta (also known as C/EPB2, LAP, TCF5, CRP2, NFIL6, IL6DBP, NF-M, AGP/EBP and Apc/EBP)

primarily regulates hormone responsiveness and oxidative stress responses and is a mediator of IL-6 (interleukin-6) signalling. C/EBP beta is thought to be involved in carbohydrate metabolism, immunity, the Thi response, female fertility and gluconeogenic pathways. C/EBP beta is capponse, female fertility and gluconeogenic pathways. C/EBP beta is response, female fertility and gluconeogenic pathways. C/EBP beta is nighest expression found in the lung. It is also expressed at a higher level in malignant ovarian tissue compared with normal ovarian tissue, and its expression in pancreas is upregulated in response to chronically elevated levels of glucose, indicating that it is involved in the impairment of insulin secretion in type II diabetes. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with C/EBP beta expression, such as cancer (particularly ovarian cancer), tumour formation, diabetes (particularly type II diabetes), infection, or inflammation 888888888888888888888888

- can be useful Synthetic beta-galactosidase inactive in milk but active in vivo chemically activated and used to treat lactose intolexance, also in cheese production.

Example 1; Page 13; 38pp; English.

Primers 1 and 2 (AAV32913) were used in a PCR reaction to amplify the bovine lactoferrin cDNA. The PCR product was used as a tail which was used through a pepsin recognition site to the 3' end of the Aspergillus niger beta-galactosidase gene. The invention provides a synthetic betagalactosidase which differs from the natural occurring enzyme in being classified in milk but capable of being activated by a chemical or condition naturally present in the gastrointestinal tract of humans. The design of this synthetic enzyme comprises of a tail domain fused to the

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various oblymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also

ö
beta-galactosidase through a cleavage site. The presence of the tail domain renders the enzyme inactive and it can also be used as a purification handle. The synthetic beta-galactosidase is claimed to be able to hydrolyse lactose in vivo to overcome lactase intolerance and thereby reduce associated gastrointestinal disorders. The synthetic beta-galactosidase is also claimed to be useful in cheese making whereby it is activated by chymosin when added to milk

The sequences at number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                      ô
                                                                                                                                                                                                                                                                                                                  Human, variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.
    useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention discloses seven kinds of full length and partial sequences of a yak milk protein gene. They include alpha-lactoalbumin gene full length sequence, alpha-lactoalbumin gene 5' lateral wing and 3' terminal sequence, alpha S1-casein gene 5' lateral wing and 3' terminal sequence, alpha S1-casein gene 5' lateral wing and 3' terminal sequence, lateral wing and 3' terminal sequence, beta casein gene 5' lateral wing sequence, beta casein gene 5' and 3' terminal sequence, beta casein gene 5' lateral wing and 3' terminal sequence, and lactoferritin gene 5' lateral wing sequence. This polymuchocide sequence represents an oligo relating to the yak milk protein genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present sequence is a PCR primer for plasmid pBlue-TH6, which was used in the construction of the expression plasmid pEdHCkappa-TH6. pEdHCkappa-TH6 was prepd. by inserting a gene encoding the light-chain (LC) variable region of human anti-TSH antibody (Ab) into pEdHCkappa, an expression vector for an Ab LC. pEdHCkappa-TH6, an expression vector for the prodn. of an Ab LC in an animal host cell, contains 5'3' a SV40 promoter, and base sequences encoding dihydrofolate reductase, Ab LC signal sequence and Ab LC variable and constant regions. pEdHCkappa-TH6 along with the equivalent heavy chain expression vector pEdHCG1-TH8 can be used for the prepn. of an Ab mol. in an animal host cell Expression vectors for antibody (Ab) heavy and light chains - introduced concurrently into animal host cell to produce Ab mol. which is secreted Gaps Plasmid; pBlue-TH6; construction; expression plasmid; primer; pBdHKappea-TH6; light chain; variable region; human; antibody; TSH; thyroid stimulating hormone; animal host cell; SV40 promoter; dihydrofolate reductase; PCR; polymerase chain reaction; ss. ; 0 3.4%; Score 14.4; DB 1; Length 22; 93.8%; Pred. cranscripts expressed in Xenomice. The products were used for repertoire transcripts expressed in Xenomice. The products were used for repertoire analysis. The specification describes a transgenic non-thuman mammal which has genome modification describes a transgenic non-thuman mammal which cours, so that the mammal does not display normal B-cell development. The could genome also has an inserted human heavy chain Ig locus in germline configuration, the human heavy chain Ig locus in micro constant region and regulatory and switch sequences, human J-H genes and an inserted human J-H micro constant region and regulatory and switch sequences, human J-H genes, and human V-H genes and an inserted human J-H collight chain Ig locus in germline configuration, the human kappa light chain Ig locus in mermine configuration, the human kappa light chain Ig locus where the number of V-H and V-kappa genes, where the number of V-H and V-kappa genes inserted are selected to restore normal B-cell development in the mammal. The cransgenic animals have a near complete human Ig locus, including both a transgenic animals have a near complete human in locus. They can be used for the production of human antibodies when exposed to particular anigens e.g. when exposed to human antibodies when respectively
                                                                                                                New transgenic non-human mammals - having an inactivated immunoglobulin
locus and a near complete human immunoglobulin locus, used for production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ss; PCR; primer; amplification; human; epidermal growth factor receptor; tumour; BGF; transforming growth factor alpha; TGF-alpha.

The primers AAV68617-V68618 were used to produce anti-epidermal growth factor receptor (EGF-r)-antibodies. The antibodies can be administered therapeutically to patients (human or veterinary) to treat solid tumours EGF-r is overexpressed on many human solid tumour types, and the fully human antibodies (i.e. comprising (i) and (ii)) inhibit both epidermal growth factor (EGF) and transforming growth factor alpha (TGF-alpha) binding to EGF-r (Known to lead to cellular proliferation and tumour growth). They can prevent tumour cell growth and, in combination with an antineoplastic agent, may eradicate established tumours. The fully human antibodies can minimise the immunogenic and allergic responses intrinsic to previous mouse/rat or mouse/rat-derived antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sox-9; bone regeneration; cartilage regeneration; campomelic dysplasia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated SOX-9 genes - used to develop prods. for the promotion or suppression of bone or cartilage differentiation of growth.
                               Humanised antibodies against epidermal growth factor receptor, EGF-r useful to treat solid tumours whilst inducing reduced immunogenic or allergic effects compared to mouse or mouse-derived antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                3.4%; Score 14.4; DB 1; Length 22; 93.8%; Pred. The invention also relates to a method of obtaining DNA encoding human glial cell derived neurotrophic factor or its active segments and a method of purifying and fining coarse GDNF. A composition comprising human glial cell derived neurotrophic factor and a medicinal acceptable carrier can be used in the treatment of nervous system diseases. Sequences ACA96807-ACA96889 represent PCR primers used to amplify human GDNF CDNA
                                                                                                                                                             ö
(CD) patients. Primers were designed to amplify the known coding sequence and intron/exon junctions. Unique SSCP conformers were cloned and sequenced. Alterations in SOX-9 can cause both CD and male-to-female sex reversal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human glial cell derived neurotrophic factor and its derivatives and use.
                                                                                                                                                                                                                                                                                                                                                                                                                                 derived neurotrophic factor; GDNF; PCR; primer; ss;

which are complementary to at least a portion of the human osteopontin (OPN) cDNA sequence (AAX29191). The antisense sequences are used to prevent restenosis in tissue, particularly coronary arterial tissue, especially where the patient is undergoing angioplasty, particularly percutaneous trans-luminal coronary angioplasty or directional coronary atherectomy. They prevent secretion of osteopontin by monocytes and macrophages which infiltrate to sites of inflammation following surgery osteopontin probably causes restenosis by inducing coronary artery smooth muscle cells (CASMC) to migrate to, and proliferate at, angioplasty injury sites. Sequences AAX2917-178 represent RT-PCR primers specific

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAQ73789-Q73822 are partial DNA sequences, one or more of which can be used to encode enzymes having pectin lyase (PL) activity. The Aspergillus sequence by the product the separatial sequences were derived are shown in AAR60881 and AAQ73823 respectively. These PL enzymes degrade plant cell wall components, and can therefore be used to reduce the viscosity of fruit juices. They can also be used for the production of antibodies. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Osteopontin, antisense, restenosis, coronary arterial tissue; CASMC; inflammation, coronary artery smooth muscle cell; angioplasty; human; OPN; RT-FCR; primer; ss.

                                                                              New antisense compound targeted to a nucleic acid molecule encoding human mitochondrial phosphoenolpyruvate carboxykinase useful for treating a human with a mitochondrial phosphoenolpyruvate carboxykinase-associated
                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                  AAZ95320 to AAZ95359 represent antisense oligonucleotides targeted to a nucleid acid modecule encoding human mitochondrial phosphoenolpyruvate carboxykinase (also known as PEPCK-mitochondrial, PEPCK-M; PCK2 and mtPEPCK), where the oligonucleotide specifically hybridise with and inhibit the expression of human mtPEPCK. The antisense oligonucleotides can be used for inhibiting the expression of mtPEPCK in human cells or tissues in vitro and can also be used for treating an animal, particularly a human suspected of having or being prone to a condition odisease associated with expression of mtPEPCK. They can also be used in diagnostics and as research reagents in sandwich and other assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
```

The present invention provides sequences of antisense oligonucleotides targeted at the murine and human B7-1 and B7-2 coding and mRNA sequences. The antisense sequences have phosphorothicate backbones and some nucleotides are 2'-methoxyethoxy residues. The sequences can be used in the treatment of inflammatory and autoimmune disorders, including asthma,

```
The invention provides Zea mays signal transduction proteins and encoding nucleotide sequences. The nucleic acids are useful for regulating captured sequences. The nucleic acids are useful for regulating captured specially of phytohormones, including ethylene, auxins, cytokinins, and gibberslin, to effect developmental changes in plants and provide control of plant response to environmental stresses. They may also be used as probes or amplification primers in the detection, quantitation or isolation of gene transcripts, for detecting mutations in the gene, for monitoring upregulation of expression or changes in enzyme activity in screening assays of compounds, for detection of any number of allelic variants, or for site-directed mutagenesis in enkaryotic cells. They may further be used for recombinant expression of their encoded polypeptides, as immunogens in the preparation or screening of antibodies, and in sense or antisense suppression of genes in a host cell, tissue or plant. The proteins may be used in assays for enzyme agonists or antisquists, as simunogens or antisques to obtain antibodies specifically immunoreactive with the proteins. The present sequence represents a PCR primer used for amplifying the cDNA encoding a signal transduction protein
                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                     The invention relates to antisense compounds, compositions and methods for modulating the expression of hepsin. The compositions comparise antisense compounds, particularly antisense oligonucleotides, targetted to nucleic acids encoding hepsin. The antisense compound is useful for inhibiting the expression of hepsin in human cells or tissues. It is also useful for treating an animal having a disease or condition associated with hepsin, by inhibiting expression of hepsin. It is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. It is also used in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human hepsin DNA. This sequence is used in the exemplification of the invention
                                                                                                                                                  Novel antisense compound targeted to nucleic acids encoding human hepsin, useful for inhibiting the expression of hepsin in human cells or tissues, and for treating humans having a disease associated with human hepsin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, antisense, hepsin, inflammation, tumour, gene therapy, cytostatic, phosphorothioate backbone, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to antisense compounds targetted to a nucleic acid encoding human receptor interacting protein (RIP)2 to inhibit its expression. Antisense compounds are used for treating diseases associated with RIP2 expression. They are also useful in antisense gene therapy. The present sequence is an oligonucleotide targetted to human RIP2 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               num annibense oligonucleotide that targets regions of a nucleic acid encoding human receptor interacting protein (RIP)2, for treating diseases associated with RIP2 expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an antisense compound 8-30 nucleobases in length targetted to a nucleic acid molecule encoding human hepsin. The antisense compound inhibits the expression of human hepsin. The antisense compound or the pharmaceutical composition of useful for treating animals and human having a disease or condition associated with the expression of hepsin, e.g. inflammation or tumour prophylaxis (e.g. to prevent or delay infection, inflammation or tumour formation) or as research reagents and kits. The method is useful for modulating, specifically inhibiting the expression of hepsin which may be used in research, e.g to distinguish between functions of various members of a biological pathway. The invention is used in gene therapy. The present sequence is human hepsin antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense oligonucleotides that modulate (particularly inhibit) human hepsin, useful for treating a disease or condition associated with the expression of hepsin, e.g. inflammation or tumor growth.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method (M1) for the diagnosis of dentinogenesis imperfecta type II and/or its accompanying deafness comprising determining the dentin sialophosphoprotein (DSPP) gene, its transcript and/or protein of an individual for comparison of their sequences with the normal equences and judging the individual to have higher risk of suffering from the disease then the normal population. Also described are: (1) treating dentinogenesis imperfecta type III and/or its accompanying deafness by administering a safe and effective dose of normal DSPP and/or DSP protein to patients; (2) drug compositions containing safe doses of DSPP and/or DSP protein; and (3) a regent kit for detecting dentinogenesis imperfecta type II and/or its accompanying deafness containing probes for binding to the mutation site. The DSPP gene and protein sequences have auditory activity. The method (M1), dentin sialophosphoprotein (DSPP) gene and DSP protein are useful for diagnosing and treating imperfecta type II and/or its accompanying deafness. The DSPP gene is located to chromosome 4421. The present sequence represent sequence invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
